Configuring the Call Manager

The Call Manager acts as the central signaling server, responsible for call setup, management, and teardown.

- Assign a static IP address
- Enable SIP or SCCP services
- Register IP phones with correct extension numbers

Sample configuration snippet:

```plaintext

ip dhcp pool VOIP_POOL

voice service voip

allow-connections sip to sip

max-ephones 10

ephone-dns 1

ip 192.168.1.100
```

```

## Configuring IP Phones

- Set the IP address and subnet mask
- Set the Call Manager's IP address for registration
- Choose the appropriate protocol (SIP/SCCP)
- Assign extension numbers

Sample SIP configuration:

```plaintext

SIP Profile: Default

Registrar Server: 192.168.1.100

```

Implementing QoS for Voice Traffic

VoIP quality heavily depends on prioritizing voice packets to reduce latency, jitter, and packet loss.

Steps include:

- Marking voice packets with Differentiated Services Code Point (DSCP) or Class of Service (CoS) values
- Configuring QoS policies on switches and routers
- Applying trust boundaries to ensure proper classification

Example QoS configuration:

```plaintext

class-map match-all VOICE
